Professional Summary

Senior software engineer with 6+ years designing backend services, AI infrastructure, and developer tooling in Go, Python, TypeScript, Rust, C, and C++. Most recently architected agentic runtimes and LLM gateway infrastructure under production safety and reliability constraints; previously led architecture and delivery of an anomaly detection system analyzing terabyte-scale telemetry as product owner.

Technical Skills

Languages: Go, Python, TypeScript, Rust, C, C++

AI Infrastructure: LLM gateways, model orchestration, agentic runtimes, context engineering, provider abstraction

Backend & Data: REST APIs, NestJS, PostgreSQL, SQLite, Drizzle, embedded key-value stores (redb, Pebble), SSE streaming

Frontend: React, Next.js, shadcn/ui, Qt, Tailwind CSS

DevOps & Cloud: Docker, GitLab CI, Vercel, Railway, Supabase, testing automation

Experience

Software Developer (Contract) | Hypotenuse Labs

Jan. 2025 – Feb. 2026

AI Tooling & Infrastructure

- Architected a Discord-based agentic system within strict context, safety, and reliability constraints, supporting persistent memory, sandboxed execution, and multi-model routing across multiple provider APIs.
- Reduced irrelevant tool calls and token waste by designing progressive tool disclosure, exposing tools only when relevant to conversation state and user role, and by normalizing heterogeneous Discord inputs into bounded prompts.
- Built hot-swappable model orchestration with file-based runtime configuration, allowing task-specific providers and system prompts to change without restarts as provider capabilities evolved.
- Minimized user-facing failures by converting provider outages, API inconsistencies, and platform quirks into agent-readable tool results, enabling retries, fallbacks, and natural-language recovery.
- Developed an OpenAI-compatible LLM reverse proxy with unified provider adapters, token quotas, SSE-backed priority queues, and request auto-healing for inconsistent model APIs, routing over \$100k of token usage across the organization.

Backend Software Developer | Sandvine

Jan. 2021 – Aug. 2024

Lead Developer & Product Owner of Alert Engine

- Owned architecture and delivery of an anomaly detection engine querying terabyte-scale network telemetry datasets on a five-minute cadence using statistical and ML-based classifiers, coordinating design decisions and task delegation across a cross-functional team.
- Extended a performance-critical distributed packet-processing system in C to ingest additional protocol types without degrading throughput.
- Built a React/Go internal tool for parallel traffic simulation and error visualization, accelerating anomaly-detection test and validation cycles.
- Designed GitLab CI pipelines and repository bootstrap tooling, establishing a one-hour developer onboarding experience.
- Led sprint ceremonies and daily coordination for a cross-functional team of eight, shipping three on-time major releases.
- Mentored multiple developers through structured code reviews and coding standards, maintaining quality across a performance-critical codebase.
- Automated API data extraction and report normalization, replacing a multi-hour manual process with scripts delivering consolidated reports in seconds.

Embedded Software Engineer (Co-op) | Tesla

Jan. 2020 – Apr. 2020

Supercharger Team

- Developed embedded C code and CAN DBC definitions to send and receive multiplexed data between vehicles and charger components.
- Interpreted and diagnosed CAN bus signals from physical charge tests involving spoofing faults to ensure correct recovery behaviour and system robustness.

Software Engineer (Co-op) | Inscopix

Sep. 2019 – Dec. 2019

Sole Developer & Product Owner, Inscopix Data Processing Software (IDPS)

- Owned delivery of a 3D cell-detection workflow for neuroimaging videos, automating manual cell masking/tracking through Python/MATLAB APIs and Qt UI integration for software showcased at the Society for Neuroscience 2019.

Earlier Co-op Experience | Dejero, McAfee, SAP

Jan. 2017 – Apr. 2019

Embedded, automation, and QA tooling

- Improved Dejero GateWay speed and reliability by adding multithreaded multi-server DNS requests with Boost and STL C++, plus command-line diagnostics on a custom Debian-based OS.
- Built Python/Selenium automation, scripting-language extensions, QA diagnostics, and Git migration support across McAfee and SAP products.

Projects

Civic Tech Waterloo Region | Volunteer Technical Lead & Mentor

Nov. 2025 – Present

Affordable Housing Portal

- Lead development of a Next.js platform helping housing seekers find transparent, accessible listings from affordable housing providers.
- Design backend foundations for listing CRUD, admin management, saved listings, and saved searches using Drizzle and PostgreSQL.
- Establish agile workflows, code reviews, product management practices, and mentoring for junior developers and students.

AI Translator | TypeScript, Manifest V3, Bun, Chrome, Firefox

- Published a cross-browser extension (Chrome Web Store + Firefox Add-ons) for AI-powered text and full-page translation, using multi-provider support, custom base URLs, and user-configurable prompts to deliver fluent, context-aware results where traditional machine translation loses nuance.

MCP Servers | TypeScript, Bun, Model Context Protocol, JMAP, CalDAV, CardDAV

- Built MCP servers for Fastmail and Splitwise, enabling agent workflows to read and send email, manage calendar and contact data, and create expenses through all 27 Splitwise API operations.

Education

University of Waterloo

Sep. 2015 – Aug. 2020

Bachelor of Computer Science, Honours Co-op

Waterloo, ON
